

# Jason Seh

(513) - 484- 5117 | [jassehxia@gmail.com](mailto:jassehxia@gmail.com) | [linkedin.com/in/jason-seh](https://linkedin.com/in/jason-seh) | [Portfolio](#)

## EDUCATION

**B.S. in Computer Science & Engineering, Ohio State University**

*Expected May 2029*

**Member:** Luma Consulting

## PROFESSIONAL EXPERIENCES

**Muslim Tech Collaborative - Luma Consulting**

**Columbus, OH**

*Software Engineer* | Next.js, React, Figma, Tailwind CSS, Supabase, PostgreSQL, Vercel, Git

Feb 2026 - Present

- Collaborating within a three-person engineering team led by senior mentors to architect a centralized hub for 100+ concurrent visitors and corporate sponsors while maintaining enterprise-level code quality through structured peer reviews.
- Engineering a production-grade frontend using Next.js and React, leveraging Motion for high-performance UI orchestration and ensuring seamless responsiveness across mobile and desktop viewports.
- Implementing a secure data persistence layer and member onboarding pipeline with Supabase, ensuring sub-second load times and reliable relational state management via optimized PostgreSQL queries.
- Translating high-level business requirements from local Columbus stakeholders into technical specifications, managing the end-to-end SDLC via GitHub and Vercel to ensure rapid deployment and continuous integration of new features.

## PROJECTS

**[Acelt - HackAI](#) | Next.js, FastAPI, WebRTC, PyTorch, Librosa, Whisper, Gemini 3.0, Supabase**

*Feb 2026*

- Developed a high-performance, AI-driven mock interview platform providing real-time multimodal analysis (computer vision and audio) to evaluate candidate performance across behavioral and technical tracks. Placed 7th out of 100s of participants.
- Engineered an asynchronous audio intelligence using Whisper for transcription, Librosa for signal processing, and PyTorch for vocal metrics, optimizing the response time from 30s to <6s (80% reduction).
- Architected a scalable backend using aiohttp and aiortc for low-latency media processing and asynchronous biometric logging to Supabase, optimizing for concurrent user sessions.

**[OncoPath](#) | Next.js, FastAPI, XGBoost, SHAP, Scikit-learn, Tailwind CSS, Three.js**

*Feb 2026- Present*

- Engineered a predictive pipeline via XGBoost, analyzing 25,000+ patient records and 100+ feature sets from the MSK-MET dataset to quantify organ-specific metastatic risks with an average of 0.72 AUC-ROC score across all organ sites.
- Designed an asynchronous backend with FastAPI to execute real-time predictive simulations, allowing users to toggle 11+ high-impact genomic drivers (TP53, KRAS, PIK3CA) and patient data to observe shifting metastatic probabilities.
- Integrated SHAP to provide granular model interpretability, visually decomposing how specific genetic mutations and clinical markers directly contribute to the model's confidence scores.
- Developed a responsive, research-oriented dashboard using Next.js and Three.js featuring interactive anatomical heatmaps that map probabilistic risks across 20+ body sites to facilitate proactive clinical decision support.

**[LectureGraph](#) | Next.js, FastAPI, Cloudflare R2, PostgreSQL, OpenAI Whisper, Prisma**

*Jan 2026 - Feb 2026*

- Architected an asynchronous multimodal pipeline to discretize linear video streams into a high-dimensional knowledge graph, leveraging OpenAI Whisper for timestamped transcription and Vision-Language Models (VLMs) for visual context extraction.
- Integrated a scalable cloud infrastructure using Cloudflare R2 for zero-egress asset storage and Prisma ORM for efficient relational state management in PostgreSQL.
- Optimized system latency by offloading compute-heavy inference (Whisper/LLM orchestration) to a dedicated FastAPI backend.

**[Buckeye Sense - MakeOhio](#) | React, Vite, Supabase, Postgis, Deck.gl, MapLibre, ESP32**

*March 2025*

- Architected an asynchronous, end-to-end realtime pipeline that ingests high-frequency hashed Wi-Fi telemetry from a distributed ESP32 sensor network to visualize campus-wide human density in a 3D environment for fire rescue situations.
- Engineered a high-speed computational layer that automatically triangulates and plots device coordinates in milliseconds upon insertion into Supabase, utilizing PostGIS for sub-second location plotting.
- Developed an asynchronous data-processing logic to handle high-frequency telemetry logs with sub-second latency, visualizing location clusters to support potential fire rescue and emergency response scenarios.

## TECHNICAL SKILLS

**Languages:** TypeScript, JavaScript, Python, Java, C#

**Frameworks & Libraries:** Next.js, React.js, Node.js, FastAPI, Aiohttp, PyTorch, XGBoost, Scikit-Learn

**Database:** Supabase, PostgreSQL, MongoDB

**Tools & Platforms:** Cloudflare R2, Vercel, Git, Prisma

**Interests:** Soccer, Weightlifting, Badminton, Volleyball
